

Matlab for REU

by
Xavier Thibert-Plante

Plan

- Questions about the previous session
- Iterative process
- Logistic map
- Ordinary differential equation

?

Setup

- All the material is at <http://nimbios.org/~xavier/REU2012/>
- Create a directory for this session <workdir>
- Download all the relevant material to <workdir>
- Open Matlab
- Set the working directory to <workdir>

Iterative process

- Lets count rabbits

$$F_n = F_{n-1} + F_{n-2}$$

- Fibonacci number

$$F_1 = F_2 = 1$$

Picture from Wikipedia

+ [] - 1.0 + ÷ 1.1 x [] [] []

```
1 function [ x ] = fibonacci( N )
2 %fibonacci Returns the Fibonacci first N terms
3
4 x=ones(1,N);
5 for i=3:N
6     x(i)=x(i-1)+x(i-2);
7 end
8 end
```

Exercise

- Plot the ratio

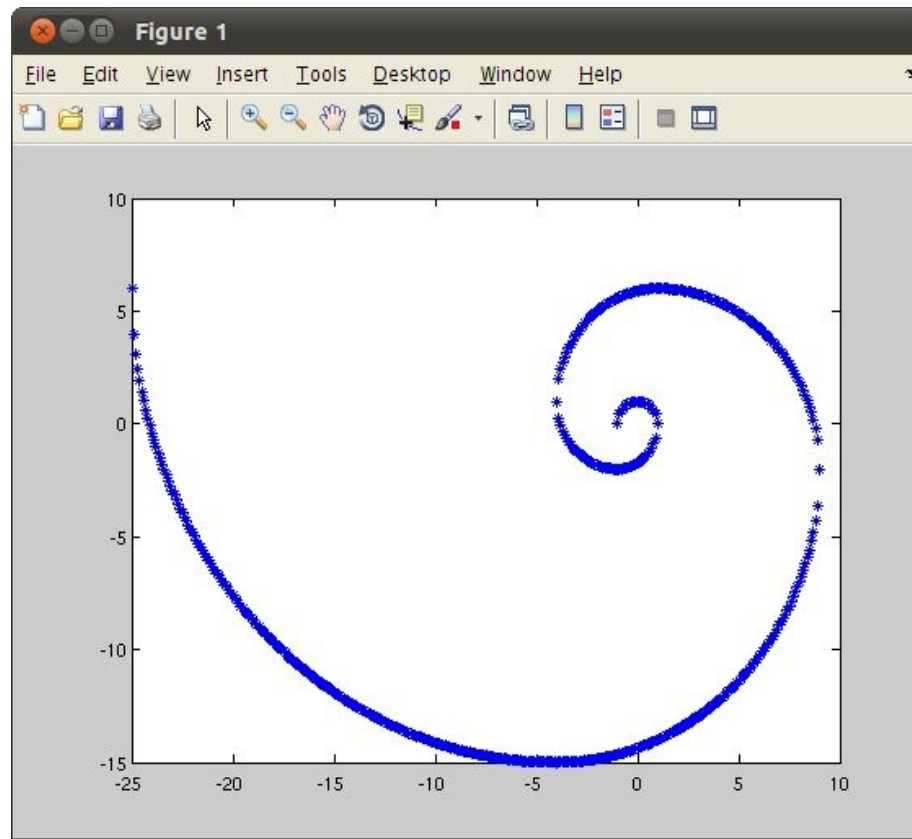

$$R_n = \frac{F_n}{F_{n-1}}$$

- What do you observe?

I converges to the golden ratio

$$\psi = \frac{1 + \sqrt{5}}{2} \approx 1.618$$

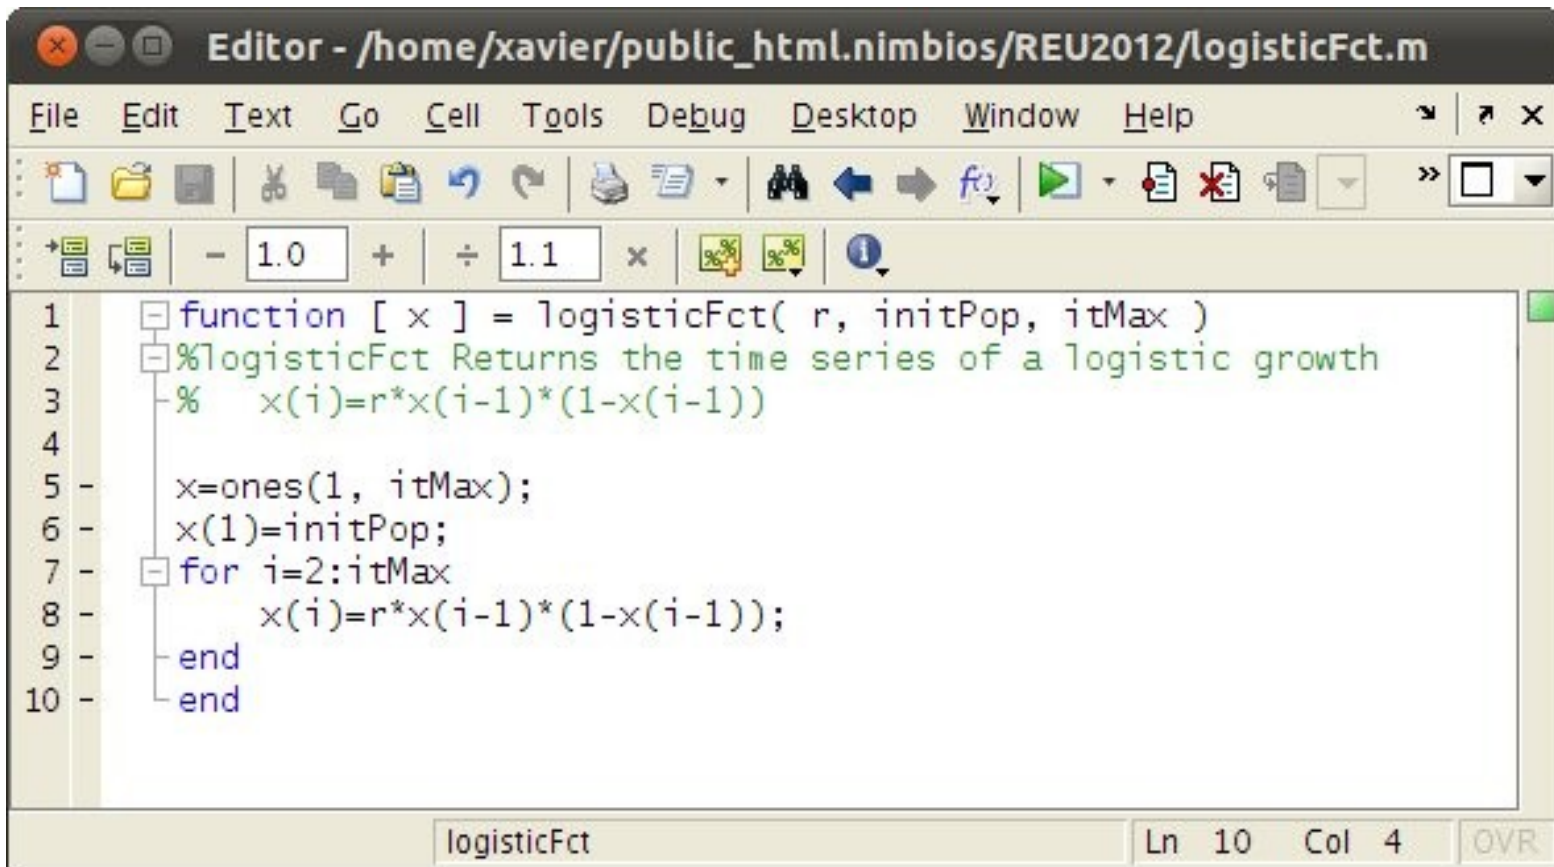

- Which may remind you of the golden spiral

<Open spiralFib.m>

Logistic map

$$N_t = r N_{t-1} (1 - N_{t-1})$$

The image shows a screenshot of a MATLAB editor window titled "Editor - /home/xavier/public_html.nimbios/REU2012/logisticFct.m". The window contains the following code:

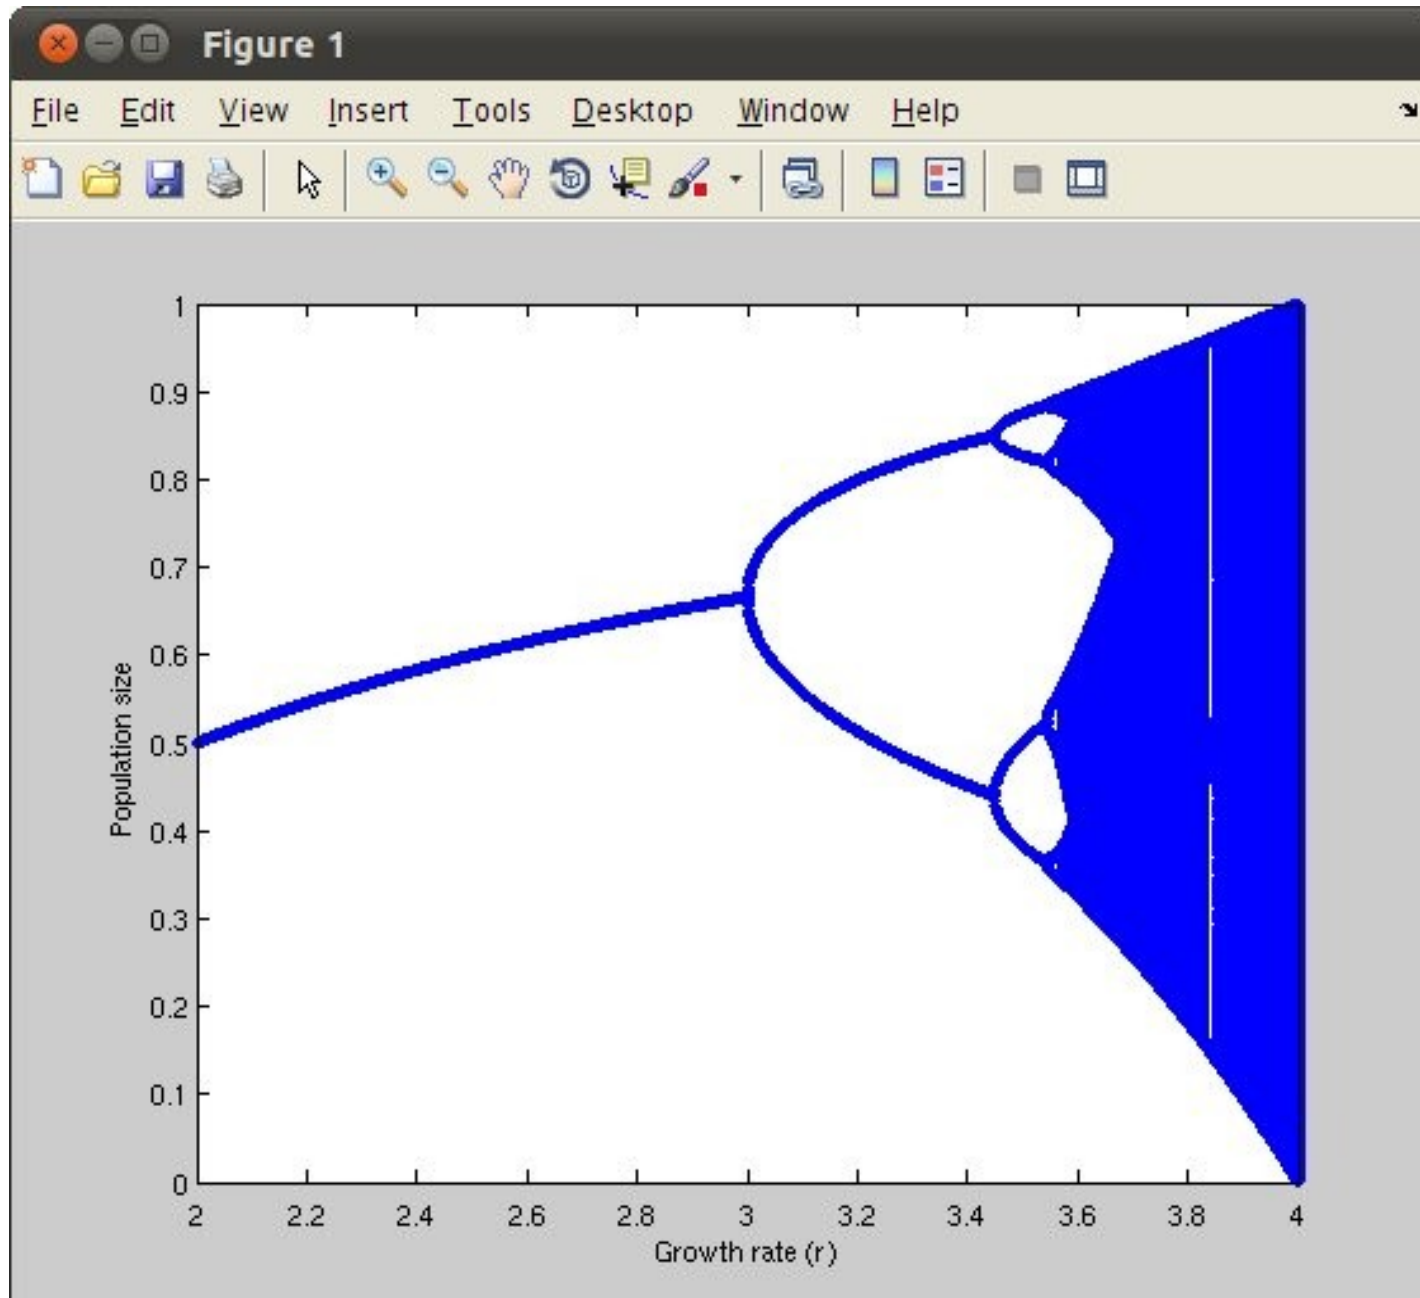

```
1 function [ x ] = logisticFct( r, initPop, itMax )
2 %logisticFct Returns the time series of a logistic growth
3 % x(i)=r*x(i-1)*(1-x(i-1))
4
5 x=ones(1, itMax);
6 x(1)=initPop;
7 for i=2:itMax
8     x(i)=r*x(i-1)*(1-x(i-1));
9 end
10 end
```

The status bar at the bottom indicates "logisticFct" and "Ln 10 Col 4".

Exercise

- Study the behavior of the time series for
 - $0 < r < 1$
 - $1 < r < 2$
 - $2 < r < 3$
 - $3 < r < 3.45$
 - $3.45 < r < 3.54$
 - $r = 3.57$
 - $3.57 < r < 3.9$
- N.B. Start your population at around 0.8 and plot around 100 iterations

Bifurcation map

File Edit Text Go Cell Tools Debug Desktop >> >> >> X

+ [] [] - 1.0 + ÷ 1.1 × % % !

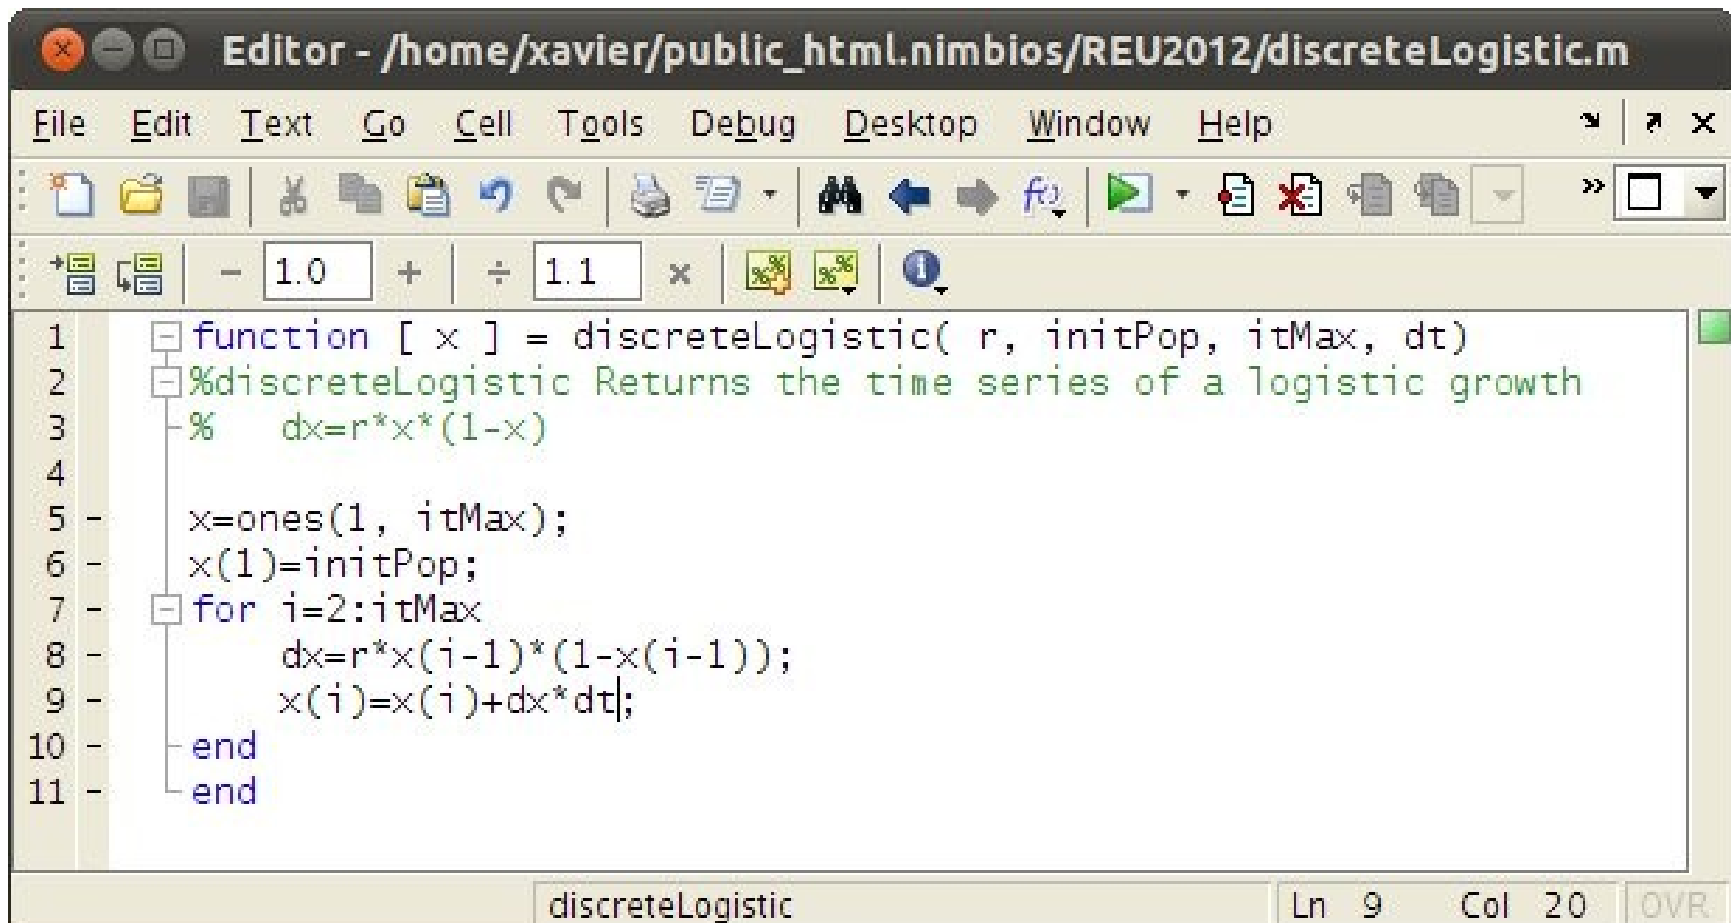

```
1 - initPop=0.8;
2 - itMax=10000;
3 - y=[];
4 - x=[];
5 - for r=2:0.001:4
6 -     tmp=logisticFct( r, initPop, itMax );
7 -
8 -     tmp=unique(tmp(1000:itMax));
9 -     y=[y tmp];
10 -    x=[x r*ones(1,length(tmp))];
11 - end
12 - plot(x,y, '.')
13 - xlabel 'Growth rate (r)'
14 - ylabel 'Population size'
```

?

Difference equation

- Logistic

$$\Delta N = r N (1 - N) dt$$

```
Editor - /home/xavier/public_html.nimbios/REU2012/discreteLogistic.m
File Edit Text Go Cell Tools Debug Desktop Window Help
+ [ ] - 1.0 + ÷ 1.1 x [%] [%] [i]
1 function [ x ] = discreteLogistic( r, initPop, itMax, dt)
2 %discreteLogistic Returns the time series of a logistic growth
3 % dx=r*x*(1-x)
4
5 x=ones(1, itMax);
6 x(1)=initPop;
7 for i=2:itMax
8     dx=r*x(i-1)*(1-x(i-1));
9     x(i)=x(i)+dx*dt;
10 end
11 end
discreteLogistic Ln 9 Col 20 OVR
```

Exercise

- Study the behavior at $r=1.5$ with different dt
 - Plot the time series, and label the x-axis correctly
 - Try different values, e.g. $dt=\{0.001,0.01,0.1,1,2\}$.
- N.B. Start your population at around 0.8 and plot around 100 iterations

Simple differential equation

- Continuous logistic growth

$$\frac{dN}{dt} = rN(1 - N)$$

Editor - /home/xavier/public_html.nimbios/REU20

Some more differential equation

- Lotka-Volterra

$$\frac{dx}{dt} = \alpha x - \beta xy$$
$$\frac{dy}{dt} = \delta xy - \gamma y$$

Editor - /home/xavier/public_html.nimbios/RE

```
File Edit Text Go Cell Tools Debug >> > > X
+ - 1.0 + ÷ 1.1 x % % % % !
1 - global alpha beta delta gamma
2 - % Define initial conditions.
3 - alpha=1.2;
4 - beta=0.8;
5 - delta=0.7;
6 - gamma=0.4;
7 - t0 = 0;
8 - tfinal = 30;
9 - y0 = [0.3 0.7]';
10 - % Simulate the differential equation.
11 - tfinal = tfinal*(1+eps);
12 - [t,y] = ode23('lotka',[t0 tfinal],y0);
13 - % plot the result
14 - subplot(1,2,1)
15 - plot(t,y(:,1),'b')
16 - hold on
17 - plot(t,y(:,2),'r')
18 - xlabel('Time')
19 - ylabel('Population size')
20 - legend('Prey','Predator')
21 - hold off
22
23 - subplot(1,2,2)
24 - plot(y(:,1),y(:,2))
25 - xlabel('Prey')
26 - ylabel('Predator')
27
```

script Ln 12 Col 39 OVR

Editor - /home/xavier/public_html.nimbios/REU20

```
File Edit Text Go Cell Tools Debug Desktop >> > > X
+ - 1.0 + ÷ 1.1 x % % % % !
1 - function yp = lotka(t,y)
2 - %LOTKA Lotka-Volterra predator-prey model.
3
4 - global alpha beta delta gamma
5
6 - yp=[alpha.*y(1)-beta.*y(1)*y(2), ...
7 -     delta.*y(1).*y(2) - gamma.*y(2)]';
```

exampleODE_Lotka.m x lotka.m* x

lotka Ln 1 Col 1 OVR

Exercise

- Modify the script to draw the isoclines

$$\frac{dx}{dt} = 0$$

$$\frac{dy}{dt} = 0$$

Thank you!
